FREE
INTERNET OF THINGS
FACULTY
PROFESSIONAL
DEVELOPMENT

July 11-15, 2022

This course will have participants “get their hands dirty” by walking through various lab assignments in support of IoT technologies. Labs will be both “high-touch” and virtual. All of the exercises demonstrated and performed during this course can be done in a typical networking classroom/lab (such as A+, Network+ or Cisco).

At the completion of this track, attendees will be able to...
* Summarize how the cross-discipline focus of “The Internet of Things” is changing the IT paradigm and how we are finally on the path to a “converged” network.
* Describe the essentials of in-depth, hands-on, interactive labs that have been (and are still being) developed in the various aspects of IoT (see below for a list of some of the labs).
* Include IoT activities into their IT and Networking curriculum and to assist them in implementing their own IoT course offerings.
